eff This is a divisional of Ser. No. 10/389,131,
filed on March 14, 2003, now US 2004/0044157 A1,
which claims benefit of 60/404,081, filed Aug. 16,
2002, and claims benefit of 60/434,892, filed
December 19, 2002.

FUNCTIONALIZED MONOMERS FOR SYNTHESIS OF RUBBERY POLYMERS

Background of the Invention

It is important for rubbery polymers that are used in
5 tires, hoses, power transmission belts and other industrial
products to have good compatibility with fillers, such as
carbon black and silica. To attain improved interaction
with fillers such rubbery polymers can be functionalized
with various compounds, such as amines. United States
10 Patent 4,935,471 discloses a process for preparing a
polydiene having a high level of affinity for carbon black
which comprises reacting a metal terminated polydiene with
a capping agent selected from the group consisting of (a)
halogenated nitriles having the structural formula $X-A-C\equiv N$,
15 wherein X represents a halogen atom and wherein A
represents an alkylene group containing from 1 to 20 carbon
atoms, (b) heterocyclic aromatic nitrogen containing
compounds, and (c) alkyl benzoates. The capping agents
disclosed by United States Patent 4,935,471 react with
20 metal terminated polydienes and replace the metal with a
terminal cyanide group, a heterocyclic aromatic nitrogen
containing group or a terminal group which is derived from
an alkyl benzoate. For example, if the metal terminated
polydiene is capped with a nitrile, it will result in the
25 polydiene chains being terminated with cyanide groups. The
use of heterocyclic aromatic nitrogen containing compounds
as capping agents can result in the polydiene chains being
terminated with a pyrrolyl group, an imidazolyl group, a
pyrazolyl group, a pyridyl group, a pyrazinyl group, a
30 pyrimidinyl group, a pyridazinyl group, an indolizinyll
group, an isoindolyl group, a 3-H-indolyl group, a
cinnolinyl group, a pyridinyl group, a .beta.-carbolinyl
group, a perimidinyl group, a phenanthrolinyl group or the
